

Commons Guild Protocol

A tokenless, forkable standard for communities that want to own their history and revolt against their hosts.

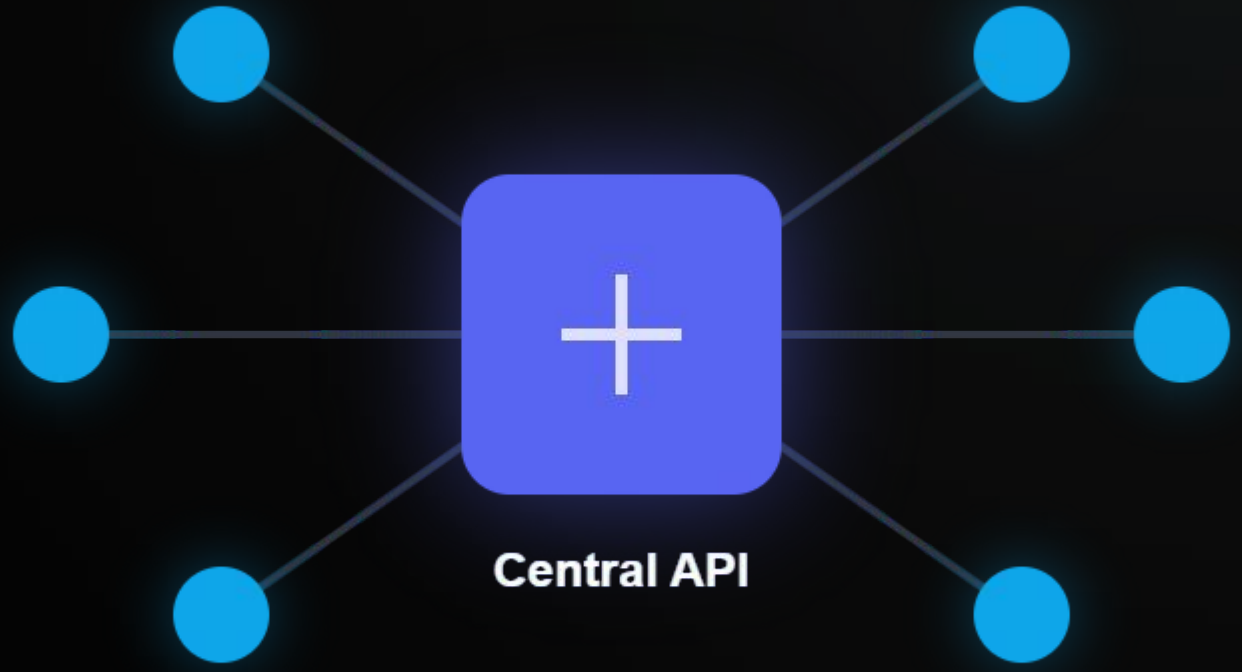

THE INCUMBENT

Discord

The gold standard for UX. Channels, roles, and voice chat just work. But the architecture is a **walled garden.**

Centralized
One company owns the database.

Platform Risk
You can be deplatformed instantly.

Client-Server Model

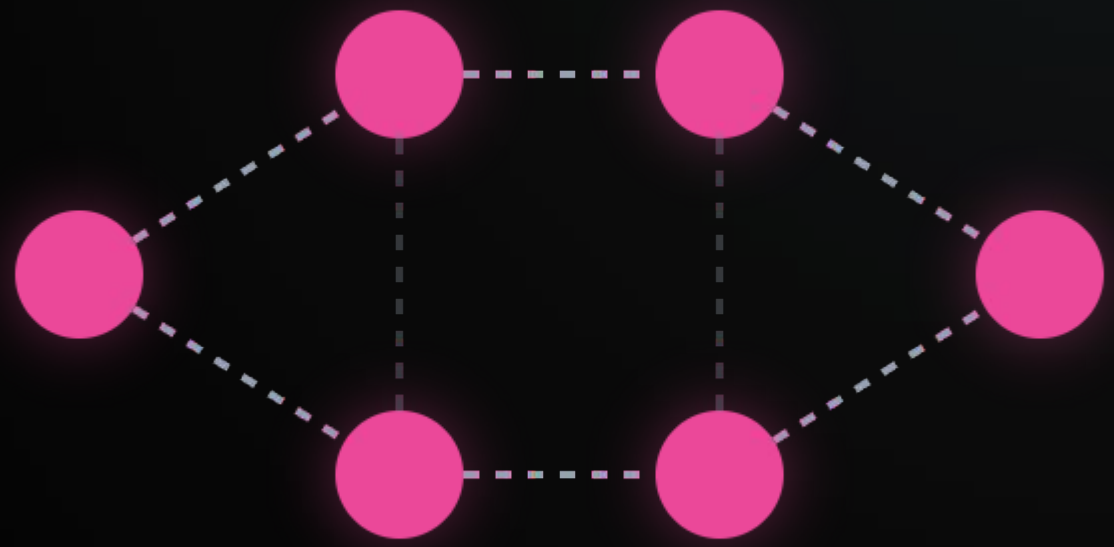

THE LOCAL-FIRST PIONEER

Secure Scuttlebutt

A peer-to-peer gossip protocol. You own your data completely because it lives on your device.

Gossip Protocol
Data spreads via friends of friends.

Sync Latency
Hard to onboard new users quickly.

Device-to-Device Gossip

Mesh Topology

matrix

THE FEDERATED STANDARD

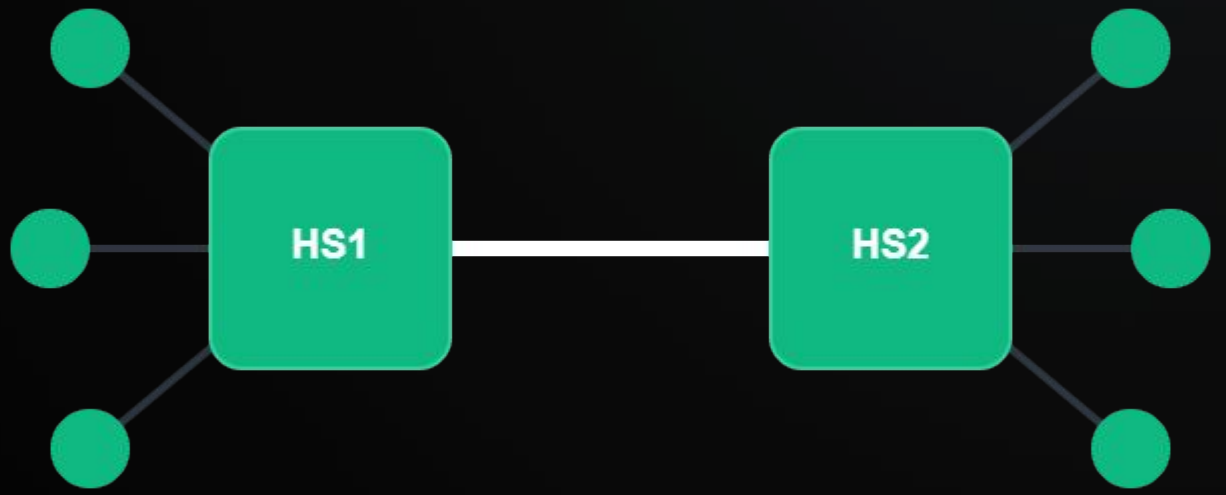

Matrix

Network for secure, decentralized communication.

Servers talk to each other to bridge the gap.

Federation
Home servers replicate room state.

Heavy State
Resolving conflicts is complex & slow.

Federated Graph

nostr

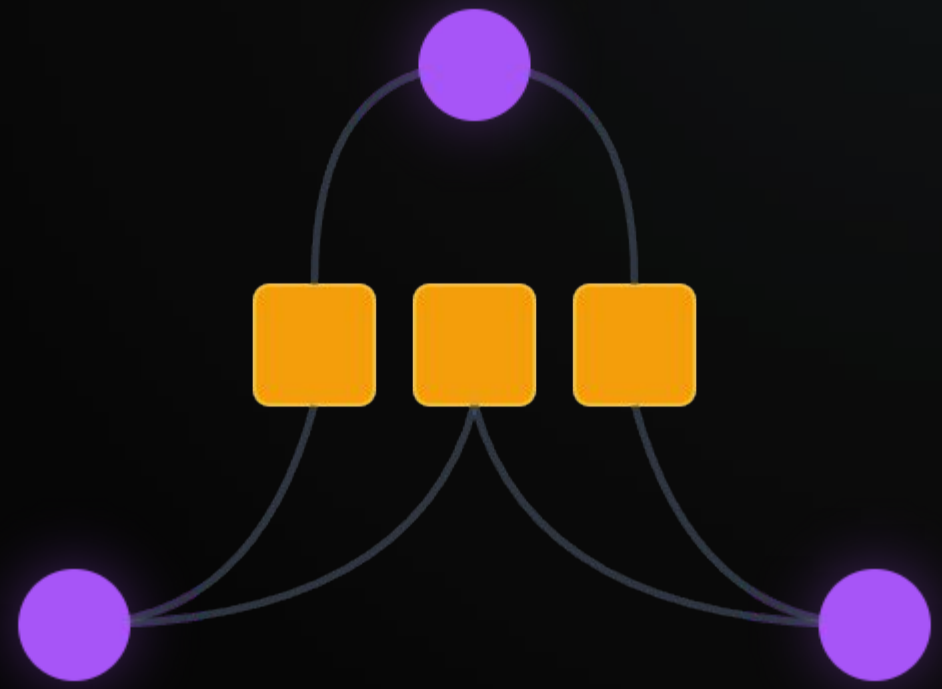

THE CENSORSHIP KILLER

Nostr

Notes and Other Stuff Transmitted by Relays. Dumb relays, smart clients. The ultimate broadcast layer.

Key-Based
Identity is cryptographic, not administrative.

No "Place"
Hard to build consistent "Guild" structures.

Clients choose overlapping relays

Relay Architecture

”We have to choose between Federation and Sovereignty.”

Current decentralized tools force users to sacrifice usability for freedom.

CGP was built to eliminate this compromise.

THE SOLUTION

Commons Guild Protocol

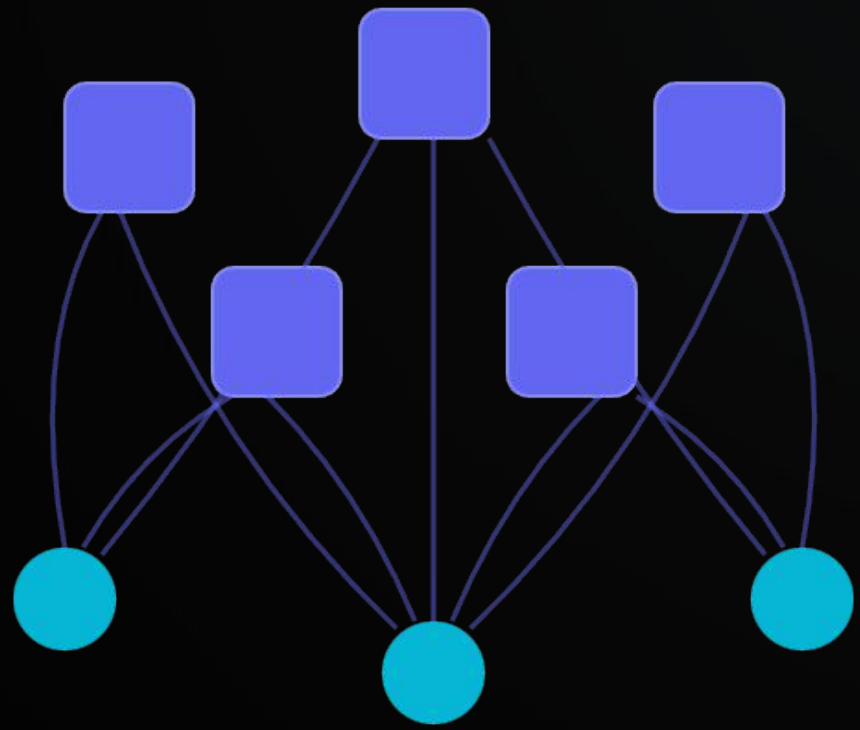

A relay role architecture that separates **Discovery** from **Hosting**.

We treat "guilds" as relays, creating a portable, verifiable container for community history.

Tokenless

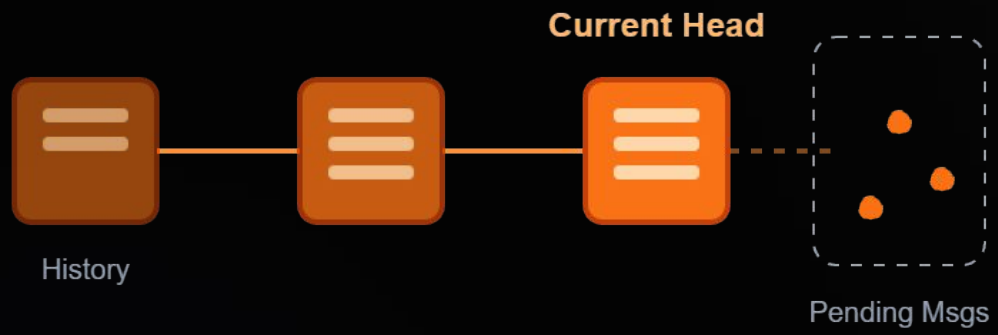

Forkable

Verifiable

Sovereign Hosting + Hyper-Federation

Nuclear Federation

Append-Only History

Merkle-linked batches (like blocks)

Append-Only Log

CORE PRIMITIVE

Verifiable History

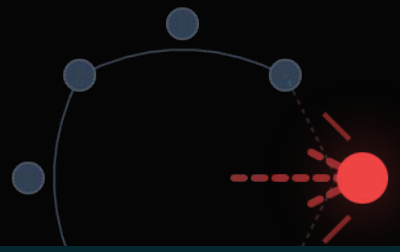

Every message, role change, and invite is an event in a signed, hash-linked chain. Just like Git.

Tamper Evident

If a server deletes history, the hash chain breaks.

Portable

You can download the entire log and host it elsewhere.

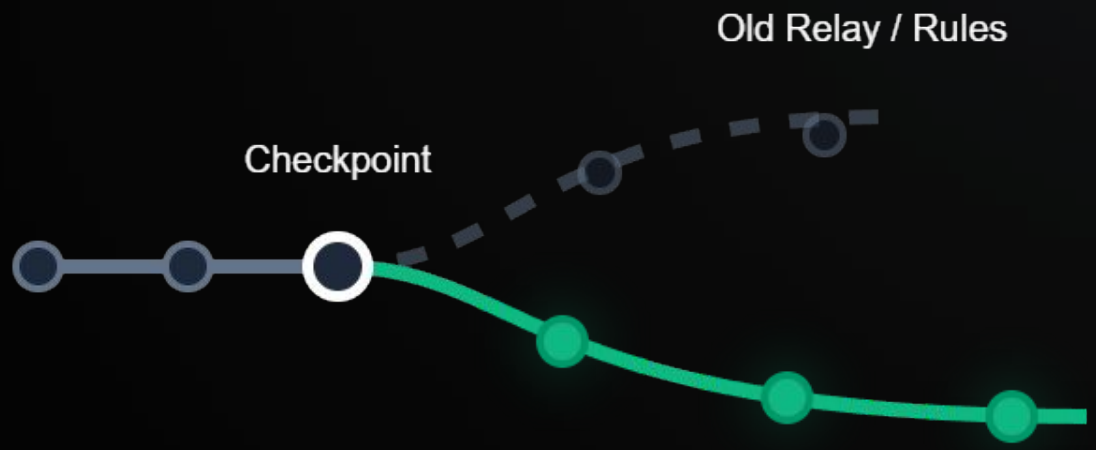

GOVERNANCE

The Right to Exit

In centralized apps, if you disagree with the admin, you leave and lose everything.

In CGP, you fork.

You can clone the guild state at any block height and continue on a new relay with a new policy. This keeps moderators honest.

Merkle State Forks

Live Demo :)

If it works..
